

Europe wants to set a price for home solar power generation

In June 2025, for the first time, the sun became the main source of electricity generation in the EU. Installed solar photovoltaic capacity reached 406 GW in 2025, far surpassing the targets set ...

Europe's solar power capacity is surging, driving electricity prices down and occasionally into negative territory. Negative power prices highlight the need for better energy storage and grid ...

Sweden, the Netherlands, Germany, Spain, and France have each logged more than 500 hours of negative electricity prices this year, driven by excess renewable generation and volatile ...

Europeans are paying far higher electricity prices than Americans due to their rush to transition to renewable energy, generous subsidization of wind and solar, climate policies taxing ...

A recent surge in solar power generation across Europe has led to instances of negative electricity prices, particularly in Germany, the Netherlands, and Belgium. This phenomenon occurs ...

Gas and electricity prices remain at elevated levels but the sense of urgency for households and businesses to invest in solar has diminished, as rooftop support schemes in several ...

OSLO/PARIS, June 21 (Reuters) - Europe has clocked a record number of hours of negative power prices this year due to a mismatch between demand and supply as solar power generation soars,...

The EU has doubled its solar capacity in the last three years. How have subsidies made this possible, what support is still available, and what still needs to happen?

But in the short term, the challenging price environment has cooled development of new solar capacity, even where land, permits, and grid access have been secured.

Solar output in Europe is soaring and is set to boom this summer. A sunny weekend in northwest Europe plunged power prices in the region to hundreds of euros below zero on Sunday...
