What is a flow battery?

Flow batteries are a type of electrochemical ES, which consists of two chemical components dissolved in liquid separated by a membrane. Charging and discharging of batteries occur by ion transferring from one component to another component through the membrane. The biggest advantages of flow batteries are the capability of pack in large volumes.

How will the flow battery market grow?

The flow battery market is expected to grow significantly as the share of renewables increases in the primary energy mix. Despite their higher CapEx cost compared to lithium-ion batteries, flow batteries are expected to be used extensively for both front-of-the-meter and behind-the-meter applications in the next several years.
