

How big a cable is needed for a 100 kW energy storage cabinet

What size electrical cable do I Need?

The table below is used as a quick reference for determining the appropriate cable size depending on the electrical power in kilowatts (kW) & the corresponding current in amperes (amps). Aluminium cables require ~1.6 x Copper Size 2R represents two run cables. When choosing cables, Use Electrical Cable Sizing Chart to make a better choice.

How to convert kilowatts (kW) to wire (cable) size?

To convert kilowatts (kW) to wire (cable) size, you need to consider the current (amperes), voltage, power factor, and system type (single-phase or three-phase). A commonly used power factor for general applications is 0.8.

How to choose a cable size?

When choosing cables, Use Electrical Cable Sizing Chart to make a better choice. These tables help choose cable sizes for applications. Small cables might melt owing to excessive current flow. Thus, Cable Sizing Charts determine size and diameter. A smaller diameter resists energy flow more. The Medium Voltage Cable Sizing is 1KV to 100 kV.

What is the maximum current a cable needs to support?

**Here, we are just manipulating Ohm's Law, which tells us that: $Wattage = Voltage * Amperage$. So, in our example, 208.33 amps is the maximum current that the cable needs to support in order to properly provide the current to the inverter. Use the below chart as a guide to determine which size cable will be best for your application.
