

New Energy Materials Energy Storage Laboratory

Materials with novel properties will enable energy savings in energy-intensive processes and applications and will create a new design space for renewable energy generation. Breakthroughs in ...

Pioneering the next generation of energy solutions, the Novel Energy Materials lab, led by Dr. Michael Naguib at Tulane University, focuses on innovative 2D materials for advanced energy ...

The ESMI program directly supports PNNL's laboratory objective of energy decarbonization through grid control and energy storage, and ESMI's R&D activities will be central to the new Grid Storage ...

A DOE Energy Frontier Research Center led by Stony Brook University that advances and enables the deliberate design of materials and components to achieve higher performing, longer life, and safer ...

In response to the significant demands of new energy vehicles and energy storage, the research team prioritizes the development of new power (energy) technologies with high safety, long...

NLR's multidisciplinary research, development, demonstration, and deployment drives technological innovation and commercialization of integrated energy conversion and storage solutions.

From foundational science to applied research, we pursue the discovery, co-design, and development of energy materials. We work closely with industry partners to ensure our research will ...

Argonne advances battery breakthroughs at every stage in the energy storage lifecycle, from discovering substitutes for critical materials to pioneering new real-world applications to making ...

Researchers from across Berkeley Lab work together to develop scientific and technical solutions to energy storage challenges in materials, manufacturing, and systems design.

Researchers at Stanford and SLAC have developed an innovative iron-based material for energy storage in batteries, achieving a capacity that previously seemed unattainable.
