Should solar panels be connected in series or parallel?

Connecting panels in series increases voltage, while parallel connections boost current. Both methods are often combined for optimal power output. Connecting solar panels in series is a fundamental method for boosting the overall voltage of a photovoltaic (PV) array.

How PV panels are connected in series configuration?

The following figure shows PV panels connected in series configuration. With this series connection, not only the voltage but also the power generated by the module also increases. To achieve this the negative terminal of one module is connected to the positive terminal of the other module.

How are PV modules connected in series and parallel?

In large PV plants first, the modules are connected in series known as "PV module string" to obtain the required voltage level. Then many such strings are connected in parallel to obtain the required current level for the system. The following figures show the connection of modules in series and parallel.

What is a series connected PV module?

The entire string of series-connected modules is known as the PV module string. The modules are connected in series to increase the voltage in the system. The following figure shows a schematic of series, parallel and series parallel connected PV modules. PV Module Array To increase the current N-number of PV modules are connected in parallel.
