

Sheep dung is hidden under the photovoltaic panels

A study on the benefits of co-locating solar energy and sheep grazing shows that sheep grazing in the shade of PV modules may produce higher-quality wool than those on traditional...

Hillview Farm owner Natalie Cohen (center) grazes her sheep at a solar farm in Enfield. The solar farm is owned by West Hartford-based Verogy, which uses the sheep to maintain the site's ...

Researchers compare sheep grazing in front of solar panels and those in normal grounds and find stunning differences.

Imagine a flock of 1,700 sheep peacefully grazing underneath rows of gleaming solar panels. This unusual sight is not just a curious spectacle--it's the center of an innovative study that ...

Sheep grazing in a field of solar panels is becoming an increasingly common sight as both farmers and solar developers are starting to experiment with co-locating solar photovoltaic (PV) systems and ...

This unexpected benefit appears to stem from altered ground conditions beneath the panels, creating an environment less hospitable to common sheep parasites. Environmental ...

The results published in early 2025 were astonishing; researchers found that wool from sheep grazing under solar panels exhibited stronger fibers and even showed increased growth rates ...

At New South Wales' Wellington Solar Farm, a multi-year trial compared sheep grazing under photovoltaic arrays with those on open pasture, asking whether clean power and livestock can ...

Researchers documented greater wool growth and stronger fiber in sheep with access to the solar panel zones, compared to those in standard pastures. The shade also helped maintain ...

What if the key to tougher wool, cluckier sheep, and reduced farm expenses lay in the shade beneath solar panels?

Sheep dung is hidden under the photovoltaic panels
