

Smart coding of solar power invoice

What is smart coding?

Smart Coding is one of the new features released in the latest versions of VIM, and is focused on the coding of invoices without a purchase order, as is the Auto Coding function. Previously, with the Auto Coding functionality we could predefine the G/L account and cost objects of an invoice for a supplier in a company code.

How do I use smart coding?

Click Use smart coding in the invoice header data details. The invoice is automatically coded, based on historical coding information for the supplier. To undo the automatic coding of the invoice, click Click Save. Undo smart coding. AP users with applicable user rights have access to the Data Management view.

How does smart coding work?

Smart Coding helps to reduce the number of touches on invoices by creating coding proposals. Smart Coding automates coding of invoices that are not linked to a purchase order or a payment plan. Smart Coding uses the history of a supplier's invoices, combined with multiple invoice dimensions, to automatically code invoices.

How do I add Coding to a supplier invoice?

Go back to the invoice > Click three dots > Click Import coding from Excel. Select the report from your computer. In the Import Coding window, select Overwrite existing rows. Click Import, and the coding data is automatically used in the supplier invoice.

Basware Smart Coding boosts invoice accuracy and reporting by using advanced machine learning to deliver touchless coding and continuous process improvement.
