What is thin-film solar technology?

Thin-film solar technology represents a departure from traditional silicon-based solar panels. Instead of using thick layers of crystalline silicon, thin-film solar cells are made by depositing one or more thin layers of photovoltaic material onto a substrate.

How are thin-film photovoltaics revolutionizing solar energy research?

Front. Energy Res., 15 June 2025 Thin-film photovoltaics, particularly those based on perovskite materials, are revolutionizing solar energy research through rapid efficiency gains, innovative device architectures, and advanced modeling techniques.

What materials are used for thin-film solar technology?

The most commonly used ones for thin-film solar technology are cadmium telluride (CdTe), copper indium gallium selenide (CIGS), amorphous silicon (a-Si), and gallium arsenide (GaAs). The efficiency, weight, and other aspects may vary between materials, but the generation process is the same.

How much does a thin-film photovoltaic cost?

LCOE modeling: CdTe \$38 to \$65/MWh; CIGS high \$50s; perovskite/Si \$40 to \$45/MWh. Thin-film photovoltaics offer pathways to scalable, low-cost, and unconventional applications of solar energy. The established thin-film technologies include amorphous silicon (a-Si), cadmium telluride (CdTe), and copper indium gallium selenide (CIGS).
