

What are the black spots on the photovoltaic panels

What causes hot spots on solar panels?

Hot spots, one of the most common issues with solar systems, occur when areas on a solar panel become overloaded and reach high temperatures relative to the rest of the panel. When current flows through solar cells, any resistance within the cells converts this current into heat losses.

Why do solar panels get discolored?

Solar Cells: Photovoltaic (PV) cells are the heart of any panel, converting sunlight into direct current (DC) electricity. Over time, solar cells can crack or become discolored, especially due to UV exposure or heat stress, both leading causes of solar panel defects and power loss.

Why do I have dark spots on my solar panels?

Without a secure seal, moisture and air can enter the system, causing corrosion and substantially reducing panel performance. If you see dark spots on your panels, this could be a sign that your panels are undergoing delamination, and you should contact your installer for an inspection.

What are common solar panel defects?

Common defects detected: PID, low output, wiring errors, soiling, and shading issues. Choosing the right solar panels is one of the best ways to avoid common solar panel defects like Potential Induced Degradation (PID), solar panel delamination, and diode failure.
